

# Intro to React

# Objectives

- >> Describe what React is
- >> Understand what Webpack And Babel are doing
- >> Describe Web Components and how they are rendered via the Virtual DOM
- >> Understand what state is

# React Concepts

- >> Web Components
- >> 1 way data binding
- >> Virtual DOM
- >> JSX (which requires a "build" step)
- >> State management (Flux or Redux)

# Getting Started

- >> Package Manager (NPM, Yarn, Bower)
- >> Module Bundler (Webpack, Browserify)
- >> Transpiler(Babel)
- >> Task Runner (Gulp, Grunt)

# Components

```
class ShoppingList extends React.Component {  
  render() {  
    return (  
      <div className="shopping-list">  
        <h1>Shopping List for {this.props.name}</h1>  
        <ul>  
          <li>Instagram</li>  
          <li>WhatsApp</li>  
          <li>Oculus</li>  
        </ul>  
      </div>  
    );  
  }  
}
```

```
// Example usage: <ShoppingList name="Mark" />
```

```
function Square(props) {  
  return (  
    <button className="square" onClick={props.onClick}>  
      {props.value}  
    </button>  
  );  
}
```

# What are Props?

```
<Image source={pic} style={{width: 193, height: 110}}/>
```

- >> Customize components with parameters = props
- >> Can use destructuring to get prop name off props

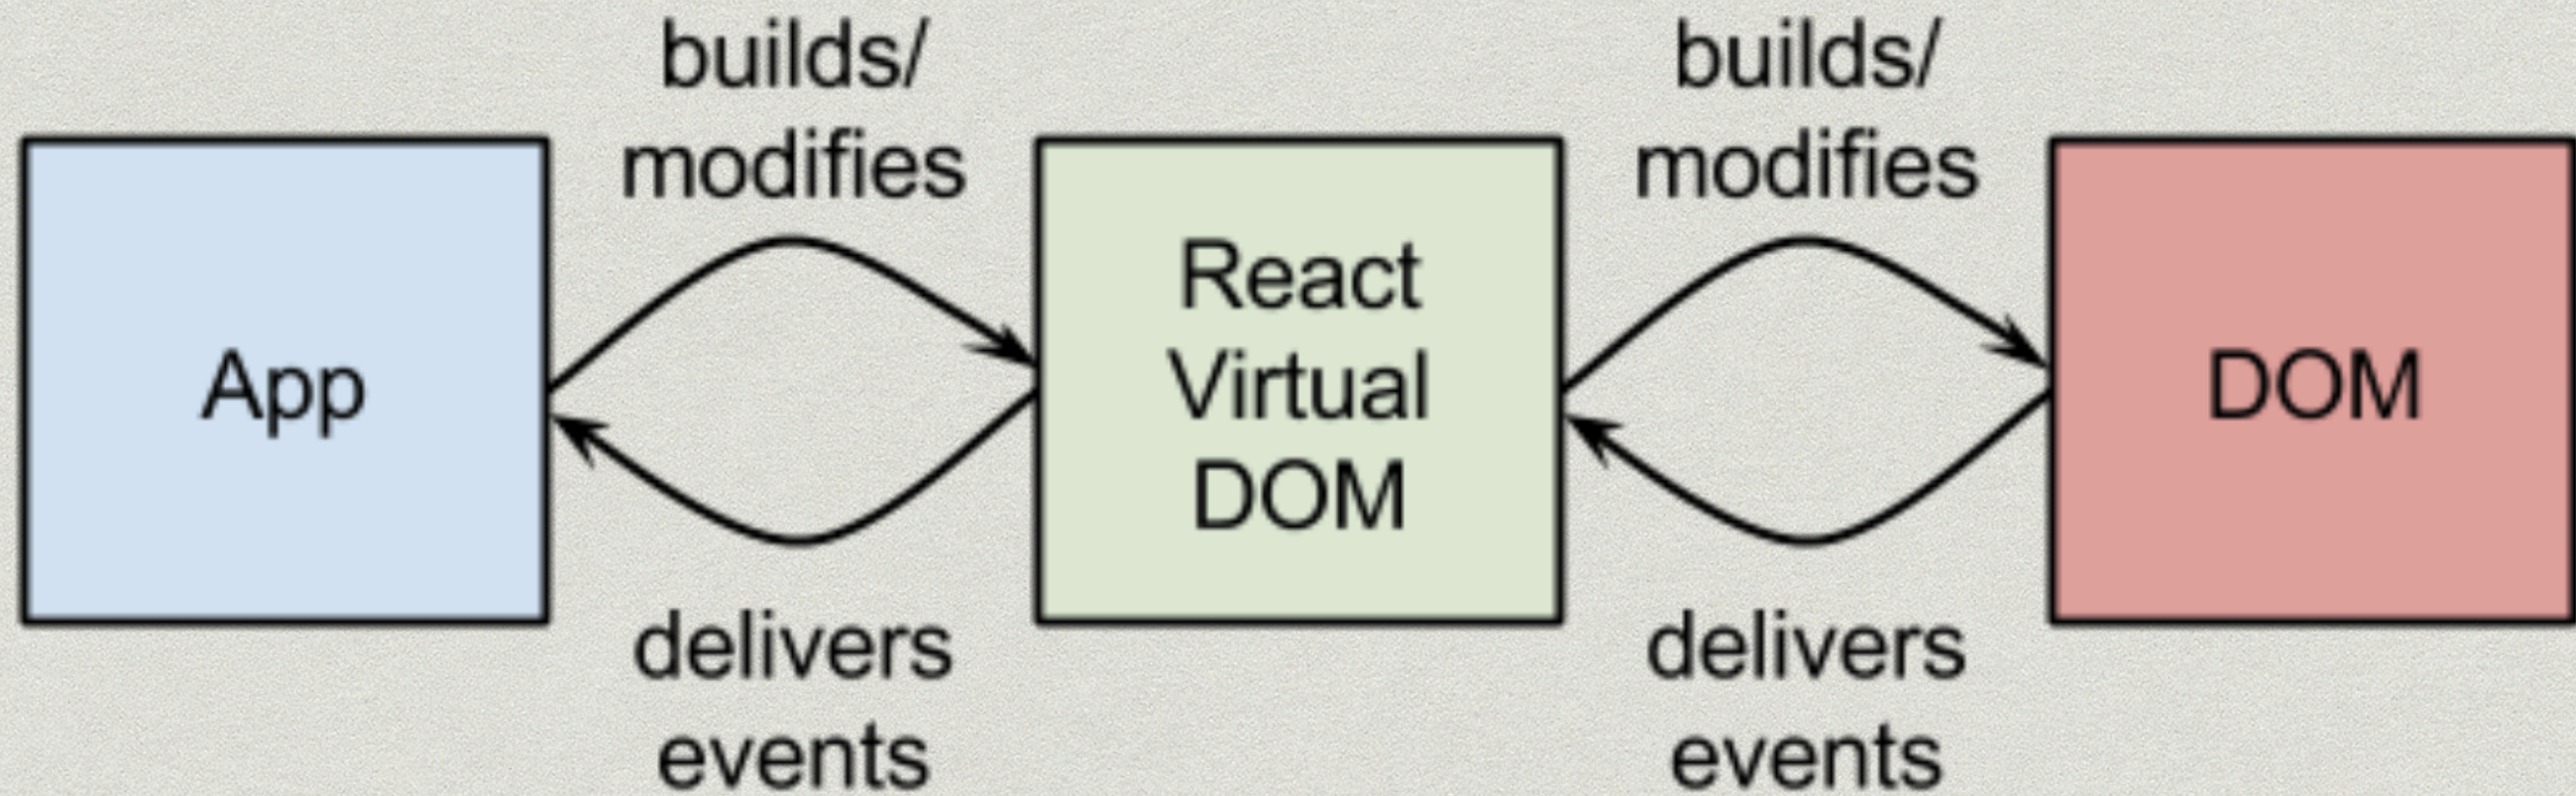

```
class Greeting extends Component {  
  render() {  
    return (  
      <Text>Hello {this.props.name}!</Text>  
    );  
  }  
}  
  
export default class LotsOfGreetings extends Component {  
  render() {  
    return (  
      <View style={{alignItems: 'center'}}>  
        <Greeting name='Rexxar' />  
        <Greeting name='Jaina' />  
        <Greeting name='Valeera' />  
      </View>  
    );  
  }  
},
```

# JSX

```
<div className="row">
  <div className="col s12">
    <p>
      The message is:
    </p>
    <blockquote>
      {text}
    </blockquote>
  </div>
</div>
```

# Virtual DOM

# Understanding State

>> constructor

>> state

>> setState()

>> render

```
class Board extends React.Component {
  constructor(props) {
    super(props);
    this.state = {
      squares: Array(9).fill(null),
    };
  }

  render() {
    const status = 'Next player: X';
    return (
      <div>
        <div className="status">{status}</div>
        <div className="board-row">
          {this.renderSquare(0)}
          {this.renderSquare(1)}
          {this.renderSquare(2)}
        </div>
      </div>
    );
  }
}
```

# Objectives

- >> Describe what React is
- >> Understand what Webpack And Babel are doing
- >> Describe Web Components and how they are rendered via the Virtual DOM
- >> Understand what state is
